

# ENERGY SOURCES

**RENEWABLE ENERGY SOURCE:** A source of energy that never runs out. The sun, wind and water give us energy we can use again and again, like a toy that never runs out of batteries. We can also get energy from plants and from the heat inside the Earth.

**NONRENEWABLE ENERGY SOURCE:** A source of energy that comes from things like old plants and animals that lived a long time ago. Over millions of years, they turned into things like oil, coal and natural gas. Once we use all of these resources, they're gone forever.

**Directions:** Cut out and place or redraw the pictures of energy sources below under the correct heading.

**RENEWABLE**

**NONRENEWABLE**

**WIND**

**COAL**

**SUNSHINE**

**WATER**

**NATURAL GAS**

**OIL**
